

## Aquarium Tank

Your aquarium tank is something that you should choose wisely. It is not something to be bought on a whim. The tank has to be suitable for what you are planning to put in it. Aquarium tanks can be used for several things, decoration, fish, amphibians or corals. All these different things need different tank types and different types of things in the aquarium. Fish are the easier thing to keep whereas corals are a lot harder than the others.

Corals require a marine setup aquarium tank, this means saltwater basically. It needs to have intensive hard lights, a saltwater level of around 0.7, this is the optimum level for fish and corals that need saltwater. Corals are like beautiful rocks, they are different coloured and also available for this type of set up are anemones. Anemones are like lots of little fingers sitting on a plant that wave around in the water and are absolutely stunning. Saltwater fish can also be incorporated in a coral tank aquarium.

Amphibians don't really need a lot of taking care of, just make sure that they have adequate water and surrounding objects that they can associate with their natural habitat. Some amphibians need water baths so that they can bath in them such as turtles and snakes, it is important to make sure that these animals have enough room and space to move around because if they don't then they may suffer from the effects of disfigurement and growing problems.

Fish are like I said the easiest to keep in a tank aquarium; they need a full tank of water, obviously. They need a filter, heater and proper lighting equipment. There are several different types of fish that can be put in an aquarium and they all need different types of habitats, so make sure that your aquarium tank suits the type of fish that you have purchased.

Aquarium tanks are of course the most essential part of any tank set up; you have to make sure that the tank suits the type of animal that you are keeping in, otherwise your animals won't live very long! Tanks are quite expensive, because they are made of reinforced and safety glass to stop the glass breaking when you fill it with water!
